COMP 3015

Introduction to PHP

Lab 3

Lab 3

The purpose of this lab is to work with forms and arrays.

Start with the `starter_kit.zip` that your instructor will provide you – this is an upgrade to the lab 2 solution. Unzip and make sure you can run the current code

- Refactor the code so that the `moments()` function is in a separate file named `functions.php`
    - `require()` this file in `lab3.php`
- Modfiy the form so that it `POST`s to itself – `lab3.php`
    - be sure to also add in the name attributes for the input elements
- All input fields are required. If an input field is missing, display an error message
- If all input fields are provided, display a thank you message with the authors full name and current time.
    - ie. this will do fine
      `Thank you Gary Tong for posting! September 16th, 2016.`

Challenge

- On each successful `POST`, write the input into a CSV text file.
- On each refresh, read the CSV text file and display the boxes similar to lab 2.

No bonus marks.

Submission

Zip up all your files and submit it to the D2L dropbox. (http://learn.bcit.ca)
